Introduction
Download Filezilla from https://filezilla-project.org/

You must have a website domain name.
You can get one from squarespace.com.
Set an A record using your the IP address for your remote server.

Log in from the command line in Windows with, for example ssh root@127.0.0.1
If you want to paste a password, right click inside your terminal.

Setting Up the Remote Server
I'm using server4you.com for the installation.
In the Dashboard tab, click Install. That option will be available when your server is ready.
You'll be in the Server Management tab.
The title of the page is Preparations for restore.
I'm installing a virtual server. The options I'm using might be slightly different. I recommend looking for Ubuntu or something similar.

I'm choosing:
Management software: none
Operating system: Debian 13 (this would be where Ubuntu is)
OS Language: English

I'm choosing a password for the server, but I'll change it when I log into the server on the terminal with SSH. (To change the password, type the command **passwd** on the terminal.)
Click confirm installation in the next step.

Your server will be ready.

Now the scripts need installed.

1. Built-in OpenSSH Client (Command Line)

- **How to use:** Open **Windows Terminal**, **PowerShell**, or **Command Prompt** and type:

  bash

  ```
  ssh username@remote_host
  ```

  Use code with caution.
- **How to install (if missing):** Go to `Settings` > `System` > `Optional features` > `View features`, search for **OpenSSH Client**, and install it. [1, 2, 3]

Now we're accessing the terminal.
I'm going to proceed with the installation on my Ubuntu server while writing this manual.
You can use Filezilla to upload files, and the terminal to run commands.
How To Use Filezilla
Use SFTP as the type of connection. You'll need the IP address of the server. The user name is **root**.
The password you used to set up your server can be used, unless you changed it on the terminal.
